MATTER AND ANTIMATTER

Matter is the particles' ensemble forming the classical matter, the one which for example is made of the Planet Earth, our environment and which is real in our present. Antimatter is matter's opposite. It represents the matter which has existed in the past or that will exist in the future.

This means that on the quantum level, antimatter is only wave or vibration and is therefore only a timeless projection of our memories, related to the idea that we make of matter.

On this point, see "Dialogues with our Angel n°37"
